55 issues with duplicate title tags	55
About this issue:	0
Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned. Moreover, identical <title> tags confuse users as to which webpage they should follow.	
How to fix:	
Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article. You can also view the On-Page SEO Basics: Meta Descriptions article

2 pages have duplicate content issues About this issue: Webpages are considered duplicates if their content is 85% identical. Having duplicate content may significantly affect your SEO performance. First of all, Google will typically show only one duplicate page, filtering other instances out of its index and search results, and this page may not be the one you want to rank. In some cases, search engines may consider duplicate pages as an attempt to manipulate search engine rankings and, as a result, your website may be downgraded or even banned from search results. Moreover, duplicate pages may dilute your link profile. How to fix: Here are a few ways to fix duplicate content issues: - Add a rel="canonical" link to one of your duplicate pages to inform search engines which page to show in search results - Use a 301 redirect from a duplicate page to the original one - Use a rel="next" and a rel="prev" link attribute to fix pagination duplicates - Instruct GoogleBot to handle URL parameters differently using Google Search Console - Provide some unique content on the webpage For more information, please read these articles: "Duplicate content" and "Consolidate duplicate URLs"	2 0
2 incorrect pages found in sitemap.xml About this issue: A sitemap.xml file makes it easier for crawlers to discover the pages on your website. Only good pages intended for your visitors should be included in your sitemap.xml file. This error is triggered if your sitemap.xml contains URLs that: - lead to webpages with the same content - redirect to a different webpage - return non-200 status code Populating your file with such URLs will confuse search engines, cause unnecessary crawling or may even result in your sitemap being rejected. How to fix: Review your sitemap.xml for any redirected, non-canonical or non-200 URLs. Provide the final destination URLs that are canonical and return a 200 status code.	2 0

1 issue with incorrect certificate name About this issue: If the domain or subdomain name to which your SSL certificate is registered doesn't match the name displayed in the address bar, web browsers will block users from visiting your website by showing them a name mismatch error, and this will in turn negatively affect your organic search traffic. How to fix: Contact your website administrator and ask them to install the correct certificate. Since subdomains also require their own certificates, you can use a wildcard or multi-domain SSL certificate that allows you to secure multiple subdomains.	1 0
1 page has slow load speed About this issue: Page (HTML) load speed is one of the most important ranking factors. The quicker your page loads, the higher the rankings it can receive. Moreover, fast-loading pages positively affect user experience and may increase your conversion rates. Please note that "page load speed" usually refers to the amount of time it takes for a webpage to be fully rendered by a browser. However, crawler only measures the time it takes to load a webpage's HTML code - load times for images, JavaScript and CSS are not factored in. How to fix: The main factors that negatively affect your HTML page generation time are your server's performance and the density of your webpage's HTML code. So, try to clean up your webpage's HTML code. If the problem is with your web server, you should think about moving to a better hosting service with more resources.	1 0
0 pages returned 5XX status code	0 0
0 pages returned 4XX status code	0 0
0 pages don't have title tags	0 0
0 internal links are broken	0 0
0 pages couldn't be crawled	0 0
0 pages couldn't be crawled (DNS resolution issues)	0 0
0 pages couldn't be crawled (incorrect URL formats)	0 0

Errors	Amount

38 pages have a low word count

38

About this issue:

0

This issue is triggered if the number of words on your webpage is less than 200.

The amount of text placed on your webpage is a quality signal to search engines.

Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.

For more information, please view [this video](#)

How to fix:

Improve your on-page content and be sure to include more than 200 meaningful words.

37 pages have low text-HTML ratio

37

About this issue:

0

Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less.

Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results.

Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix:

Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

25 external images are broken About this issue: A broken external image is an image that can't be displayed because it no longer exists or because its URL is misspelled. Having too many broken external images negatively affects user experience and may be a signal to search engines that your website is poorly coded or maintained. How to fix: To fix a broken external image, perform one of the following: - If an image was deleted or damaged, replace it with a new one - If an image is no longer needed, simply remove it from your page's code - If an image moved to a different location and you know its new address, change its URL	25 0
1 subdomain doesn't support SNI About this issue: One of the common issues you may face when using HTTPS is when your web server doesn't support Server Name Indication (SNI). Using SNI allows you to support multiple servers and host multiple certificates at the same IP address, which may improve security and trust. How to fix: Make sure that you web server supports SNI. Keep in mind that SNI is not supported by some older browsers, which is why you need to ensure that your audience uses browsers supporting SNI.	1 0
0 external links are broken	0 0
0 links on HTTPS pages lead to HTTP page	0 0
0 pages don't have enough text within the title tags	0 0
0 pages have too much text within the title tags	0 0
0 pages don't have an h1 heading	0 0
0 pages have duplicate H1 and title tags	0 0
0 pages don't have meta descriptions	0 0
0 pages have too many on-page links	0 0

47 pages have only one incoming internal link About this issue: Having few incoming internal links means little to no visits or chances of being placed in search results. How to fix: Add more incoming internal links to pages with important content.	47 0
19 orphaned pages in sitemaps About this issue: An orphaned page is a webpage that is not linked to internally. Including orphaned pages in your sitemap.xml files is considered to be a bad practice, as these pages will be crawled by search engines. Crawling outdated orphaned pages will waste your crawl budget. If an orphaned page in your sitemap.xml file has valuable content, we recommend that you link to it internally. How to fix: Review all orphaned pages in your sitemap.xml files and do either of the following: - If a page is no longer needed, remove it - If a page has valuable content and brings traffic to your website, link to it from another page on your website - If a page serves a specific need and requires no internal linking, leave it as is	19 0
lms.txt has formatting issues About this issue: If your <code>lms.txt</code> file is incorrectly formatted, AI search engines that use it may interpret your website's content less accurately. How to fix: Review your <code>lms.txt</code> file and fix all issues. Visit lms.txt.org to find out how to properly format your file.	1 0
